Homo sapiens gene for tyrosine hydroxylase, exon 9, partial
sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       In [1], they determined the nucleotide sequences of all exons and their surrounding regions of human TH gene, and the exon/intron boundaries are shown. The boundaries were determined by comparing the genomic DNA sequence with the CNRA sequence. The human TH gene is split into 14 exons. In [1], they concluded that the four types of human TH mRNA are produced through alternative splicing from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolation and characterization of the human tyrosine hydroxylase gene: identification of 5' alternative splice sites responsible for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            O'Malley, K.L., Anhalt, M.J., Martin, B.M., Kelsoe, J.R., Winfield, S.L.

PCR was performed on DNA from transformants of Arabidopsis thaliana plants from INRA (versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at http://dbsgap.versailles.inra.fr/publiclines/. This sequence has program 'Genoplante' (http://www.genoplante.com and http://genoplante-info.info.info.ingopn.fr).

Pavco, P., McSwiggen, J., Stinchcomb, D. and Escobedo, J.
Method and reagent for the treatment of diseases or conditions
Method and reagent for the treatment of diseases or conditions
related to levels of vascular endothelial growth factor receptor
Patent: US 6346398-A $410 12-FEB-2002;
